Royer T.J., Thompson S.A., Ward M., Wilson L.J., Berka R.M.,
"Cloning, characterization, and expression of two alpha-amylase genes
from Aspergillus aniger var. awamori.";
Curr. Genet. 17:2012(1990).
-! CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-! COFACYOR: Binds 2 calcium ions per subunit. Calcium is inhibitory
at high concentrations (By similarity).
-! SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

"Cloning of the alpha-amylase cDNA of Aspergillus shirousamii and its
expression in Saccharomyces convisies ";
Biosci. Biochechnol. Biochem. 56:174-179[1992].
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
linkages in oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory
at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EMBL; D10461; BAA01255.1; -.

-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory
at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SMART; SN00642; Aamy; 1.

                  MEDLINE=93365041; PubMed=8389835; Claros M.G., Abarca D., Fernandez-Lobato M., Jimenez A.; Claros M.G., Abarca D., Fernandez-Lobato M., Jimenez A.; Claros M.G., Abarca D., Fernandez-Lobato M., Jimenez A.; Molecular structure of the SWA2 gene encoding an AMY1-related alpha-amylase from Schwanniomyces occidentalis."; Curr. Genet. 24:75-83(1993).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Biochemie, TH Darmstadt, Petersenstr. 22, D-6100 Darmstadt, FRG [2] also presents a cDNA seq (clone pGM8); pGM8 is lacking the first 42 bp of the exon when compared to genomic seq and includes a poly(A) tail.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1320

see X12725 - x12727 for A. oryzae amyl, amy2 and amy3 genes. No
amy2 transcripts were detected in Northern blot analyses; exons and
introns in FT are given accordingly amyl gene (X12725) Data kindly
reviewed (28-Mar-1989) by Wirsel S.

                   The present sequence encodes a fungamyl-like alpha-amylase. The specification describes variants of this fungamyl-like alpha-amylase, which have an alteration in one the amino acid regions 98-110, 150-160, 161-167, 280-288, 448-455, and 468-475. Each alteration is a deletion or substitution of an amino acid or an insertion of an amino acid downstream of a particular position. The variants retain alpha-amylase activity, and have better heat stability and/or stability at acidic pH, relative to wild-type enzyme. The variants can therefore be used at higher temperatures (more efficient conversion or faster reaction, and have reduced need for cooling and reduced risk of contamination). The variants may also be used in conjunction with other enzymes, particularly glucoamylase during dextrinisation. The variants are used to produce syrups, particularly of high maltose content, or alcohol, from starch; as dough improver for baked goods; in brewing, to increase fermentability of the wort, and for liquefaction of starch

Monitoring differential expression of genes in filamentous fungal cells uses fluorescence-labeled nucleic acids isolated from the cells and a substrate of expressed sequence tags.
                                             Multiple gene expression; filamentous fungal cell; EST; expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryzae; Trichoderma reesei; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; se.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the retail of the same genes in one or more second filamentous fungal cells. The methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the same genes in one or more second filamentous fungal cells. Monitoring the cap global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered; cossible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of dentabolic or catabolic pathway engineering. Using ESTB provides several cavantages over genomic or random cDNA clones including elimination of redundancy as one apot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene copy reducts to facilitate analysis of the results. ARF01481 to AAF11487 copy from the free copy from Aspergillus niger; AAF1187 to AAF14878 tepresents ESTS from Fusarium venenatum; ABF11878 represents ESTS from Fusarium venenatum; ABF11878 represents ESTS from Fusarium venenatum; ABF11871 to Fusariand in the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatum of the venenatu Trichoderma reesei, which are all specifically claimed in the present

The present invention describes polynucleotides which encode processing enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose isomerase, or glucosmylase) that are optimised for expression in plants. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are activated under suitable conditions to act upon the desired substrate. Also described are self-processing transgenic plants and plant parts, e.g. grain, which express one or more of these enzymes and have an altered composition that facilitates plant and grain processing. Also described is a method (N) for converting starch to starch-derived products in a transformed plant part (TPP), by activating the starch processing enzyme contained in it. Transgenic grain is useful for preparing maltodextrin. A transformed plant (TP) can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide encoding hyperthermophilic processing enzymes e.g. alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.
                                                                                                                                                                                                                                                                                                                                                                                    Self-processing plant; plant; processing enzyme; alpha-amylase; grain; pullulanase; alpha-glucoardase; glucoardase; glucoardase; mesophilic; thermophilic; hyperthermophilic; transgenic plant; starch; maltodextrin; ethanol; fermentation; beverage; enzyme; gene; se.

produce food products having improved taste and to produce fermentable substrates for ethanol and fermented beverages. (M) eliminates the need to mill or physically disrupt the integrity of plant parts prior to recovery of starch-derived products. The present sequence encodes alpha-amylase/glucoamylase fusion protein, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CCGTACCAGAACGTGATGGACGCGTGCTCAACTACCCCGATCTACTACTACCCGCTCCTCAAC

Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological

Example 10; SEQ ID NO 17; 58pp; English

The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type Aspergillus niger et, and medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance and second nucleotide heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type appergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first uncleotide sequence encoding heterologous biological substance and second nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                      GTATTGTATCCGACTGAGGAAGTTGGCAGGTAGCAAGATCTGTAGTAGCTCGTGAAGGCTG

Monitoring differential expression of genes in filamentous fungal cells uses fluorescence-labeled nucleic acids isolated from the cells and a substrate of expressed sequence tags.

Claim 87; Page 1694-1695; 3161pp; English.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the method uses fluorescence-labeled nucleic acids isolated from the methods for monitoring differential expression of genes are used in the methods for monitoring differential expression of the same genes in one or more second filamentous fungal cells. Monitoring the same genes in one or more second filamentous fungal cells. Monitoring the came genes in one or more second filamentous fungal cells. Monitoring the companions to be improved. New genes may be discovered, or feem microorapanisms to be improved. New genes may be discovered, or gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTS provides several advantages over genomic or random CDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene cop products to facilitate analysis of the results. Novel isolated Aspergillus fumigatus polypeptide, useful in various industries such as those involved in the making of food and feed, beverages, textiles and detergents.

Claim 2; Page 132-34; 169pp; English.

The sequences given in ABG80119-66 encode enzymatic proteins derived from C. A. funigatus. The resulting proteins display the catalytic activity of an enzyme such as tannase, cellulase, glucose oxidase, glucoamylase, phytase that a tannase are polygalaturonase or xylanase. Compositions comprising the tannase are useful for modulating the amount of compositions comprising dallate are useful for modulating the amount of cellulose in a composition. Compositions comprising the amount of glucose oxidase are useful for modulating the amount of cellulose in a composition composition of myo-inosical phosphates of a composition. Compositions comprising plucose oxidase are useful for modulating the amount of accessing phytase are useful for modulating the amount of lactose in a composition. Compositions comprising phytase are useful for modulating the amount of lactose in a composition composition composition composition composition composition in a composition of access are useful for modulating the amount of glyceride in a composition composition comprising alpha-amylases are useful for modulating the amount of glyceride in a composition composition comprising comprising in a composition. Compositions comprising comprising in a composition comprising phytalacturonases are useful for modulating the amount of xylan or xylo-oligomers are useful for modulating the amount of xylan or xylo-oligomers computation. The composition composition composition composition composition composition comprising plygalacturonic acid chains in a composition for modulating the amount of xylan or xylo-oligomers composition. The composition co
